

# Nature-based solutions hold the key to transform our cities into resilient spaces

The URGENT team provided the training on "Nature-Based Solutions" on Saturday 31 July 2021. The leading lecturers were [Dr. Anton Shkaruba](#) and [Dr. Yogesh Gokhale](#).

Co-funded by the  
Erasmus+ Programme  
of the European Union

Urban Resilience and Adaptation for India and Mongolia:  
curricula, capacity, ICT and stakeholder collaboration to support green & blue infrastructure and nature-based solutions  
619050-EPP-1-2020-1-DE-EPPKA2-CBHE-JP

## URGENT Lecture Series

1<sup>st</sup> Lecture

### Nature Based Solutions (NBSs)

**Date :** 31 July 2021, Saturday  
**Time :** 1230 – 1400 Hrs IST

Connect to   
**Join with Google Meet**

#### Speakers

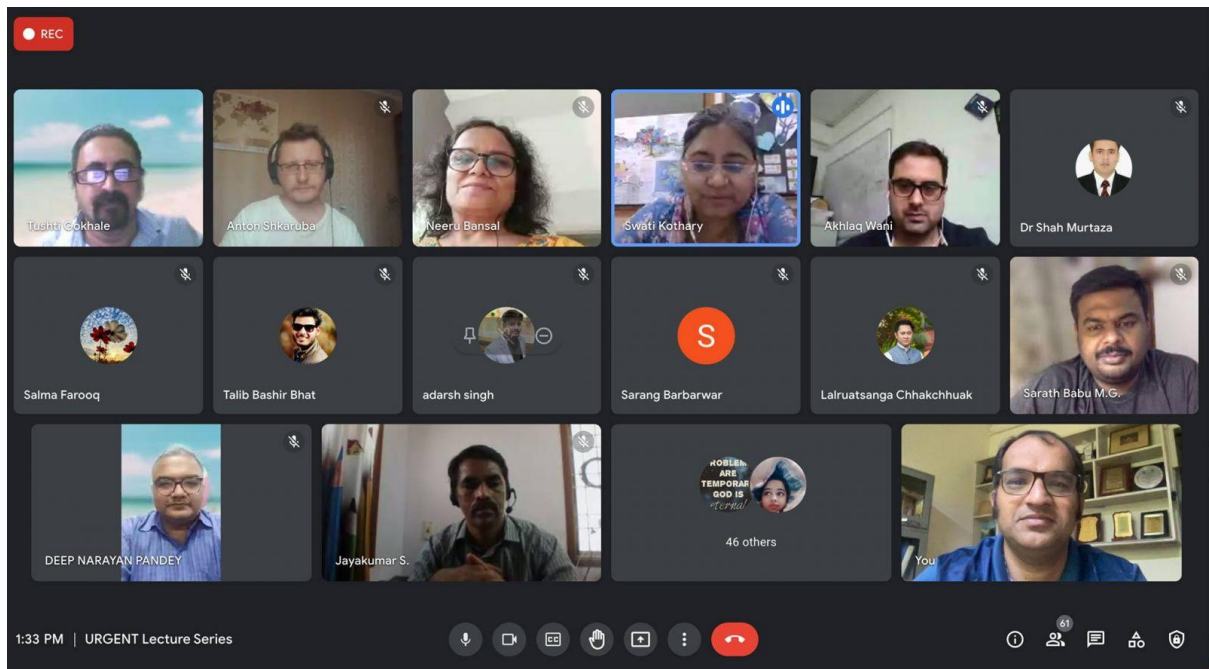

**Dr Yogesh Gokhale**  
*Senior Fellow*  
*The Energy and Resources Institute (TERI),*  
*New Delhi, India*

He is an ecologist with specialization in natural resource management, monitoring and evaluation of watershed projects and ecological assessments in different parts of India. He has extensively worked on people and forest interface issues regarding conservation of biological resources such as sacred groves in India. Some of his research topics include forest ecology, non-timber forest produce, medicinal plant conservation, community forestry, eco-development, and national and international biodiversity policy issues.

**Dr Anton Shkaruba**  
*Senior Researcher*  
*Estonian University of Life Sciences,*  
*Tartu, Estonia*

His research focus is on biodiversity governance, urban planning and science-policy interfacing. He was a lead author for the IPBES Europe & Central Asia regional assessment, and currently a lead author of the IPBES assessment on sustainable use of wild species. He has worked in interdisciplinary projects focusing on mapping and spatially-explicit assessment of ecosystem vulnerability to global environmental change, adaptation of social-ecological systems and sectors (forestry, biodiversity conservation) and, more recently, also land-use planning and policies.

## Lecture content

- *Nature-based solutions are emerging as powerful allies to address global interlinked challenges of climate change, biodiversity loss, and degradation of ecosystems in urban areas.*
- *Several cities have initiated a shift in their urban planning approach by harnessing the power of nature to provide environmental and societal benefits.*
- *The potential of mainstreaming nature to climate-proof cities is now widely acknowledged, but these need to be seamlessly integrated with the overall city development plans with a more connected and collaborative approach amongst various stakeholders.*
- *The views expressed in this commentary are that of the authors.*

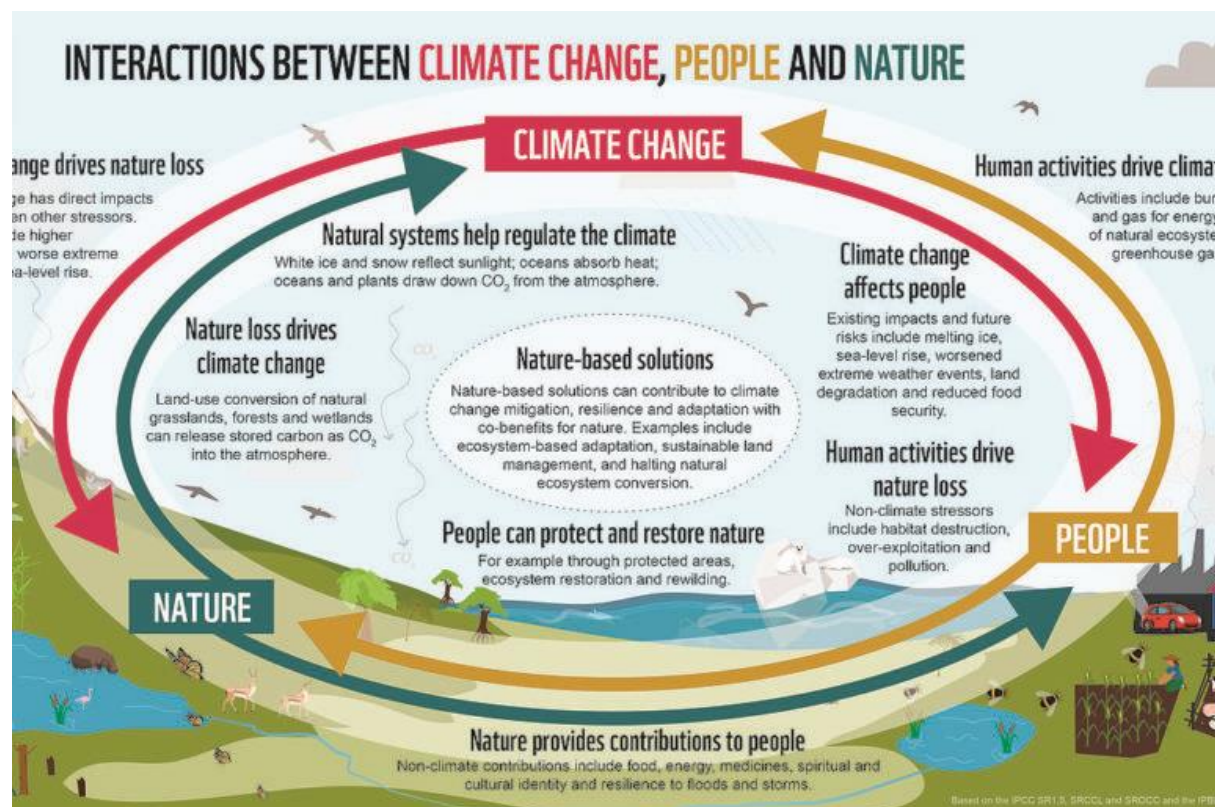

Delhi recently launched its draft [Master Plan 2041](#)— a vision document for the city’s development over the next two decades. The draft plan envisages making Delhi environmentally sustainable, liveable, and economically and culturally strong, with an enhanced focus on environmental protection. While seeking to address the issues of air and water pollution, and overall disharmony with the natural environment, consequences of rapid and unplanned urbanisation, [the new Master Plan aims at the redevelopment of the city’s green and blue assets, which means increasing the forest and green cover, and protecting and conserving the water bodies.](#)

In recent times, the increased intensity and frequency of climate-related hazards have often disrupted urban economies and infrastructure. Further, rapid urbanization leading to higher demand for energy and water, higher carbon emissions, air pollution, and adverse health impacts, makes it imperative for cities to adopt climate-resilient and low carbon development plans. Several cities are harnessing the power of nature to address the impacts of climate change, and adapting urban planning approaches towards a deeper focus on blue (like rivers, lakes, and wetlands) and green (such as trees, parks, gardens, playgrounds, and forests) spaces.

Nature-based solutions can augment the efforts to reduce urban greenhouse gas emissions and help us adapt to the impacts of climate change. Besides addressing climate-related impacts, such solutions provide multiple co-benefits in terms of improving air and water quality, enhancing green cover and biodiversity, while creating healthy and sustainable living spaces.

Nature-based solutions (NbS) are [defined](#) by the International Union for Conservation of Nature (IUCN) as *actions to protect, sustainably manage, and restore natural or modified ecosystems, that address societal challenges effectively and adaptively, simultaneously providing human well-being and biodiversity benefits.*

The importance of [nature](#) has been re-emphasized and reinforced in the current pandemic situation as the world collectively experienced the close interaction between human health and the health of the planet. There is now a concerted call for policymakers to integrate nature into COVID-19 response and recovery efforts, while fully incorporating nature-based solutions into future climate goals. In India, several initiatives undertaken in urban areas demonstrate the role of nature-based solutions in climate-proofing cities.

*Interactions between climate change, people, and nature. Graphic by WWF.*

Last year (2020), the Indian government launched the Nagar Van Scheme to develop 200 urban forests across the country in the next five years, with a renewed focus on people's participation and collaboration between state and non-state actors. Interestingly, the inspiration was the success of Warje Urban Forest in Pune, also called 'Smruti Van,' which was a noteworthy example of a collaborative effort between the Forest Department, civil society, and the corporate sector to revive green cover in the city. In the past few years, cities such as Mumbai, Bengaluru, and Chennai have developed Miyawaki forests, an afforestation technique that uses native species to grow multi-layered, dense forests.

Thereafter, several other municipal authorities and organizations have adopted this concept. [Delhi's seven biodiversity parks around the Yamuna floodplain and the Aravalli landscape have led to a healthy restoration of the city's native flora, and fauna.](#) There are similar efforts to conserve urban biodiversity in Indian cities. The East Kolkata Wetlands being the world's only fully functional organic sewage management system has been treating over 900 million litres per day (900 MLD) of Kolkata's wastewater resulting in multiple direct and indirect benefits such as sequestering carbon, mitigating environmental degradation, reducing public health risks, and yielding livelihoods.

Since [Bengaluru got its first vertical garden](#), several more have been developed in cities across the country [to lower the pollution levels and beautify urban spaces.](#) Kochi is one of the first cities in India to prepare an informed and participatory local biodiversity strategy and action plan.

Nature-based solutions are emerging as a practical approach to address interconnected challenges of climate change, biodiversity loss, and degradation of ecosystems in urban areas. According to the UNEP's State of Finance for Nature [report](#), a total investment in nature of USD 8.1 trillion is required between now and 2050 to successfully tackle the interlinked climate, biodiversity, and land degradation crises.

Nature can effectively complement existing solutions to tackle climate change-related impacts and increase adaptation and resilience. Measures such as enhancing urban forests, green cover, and biodiversity, restoring wetlands, implementing green roofs for [providing urban cooling and long-term energy saving, developing sustainable drainage systems, and conserving mangroves,](#) are effective approaches under nature-based solutions. In the longer term, keeping nature at the core of efforts to mitigate climate change, and adapt to risks and hazards, would be critical in safeguarding human health and environmental well-being.

*A murmuration of European starlings with some Asian pied starlings and bank mynas in the Basai wetland near Gurugram, Haryana. [Photo](#) by T. R. Shankar Raman/Wikimedia Commons.*

## **More work is needed to integrate nature-based solutions with city development plans**

While nature-based solutions have immense potential for climate-proof cities, there is still a long way to go before they are seamlessly integrated with the overall city development plans.

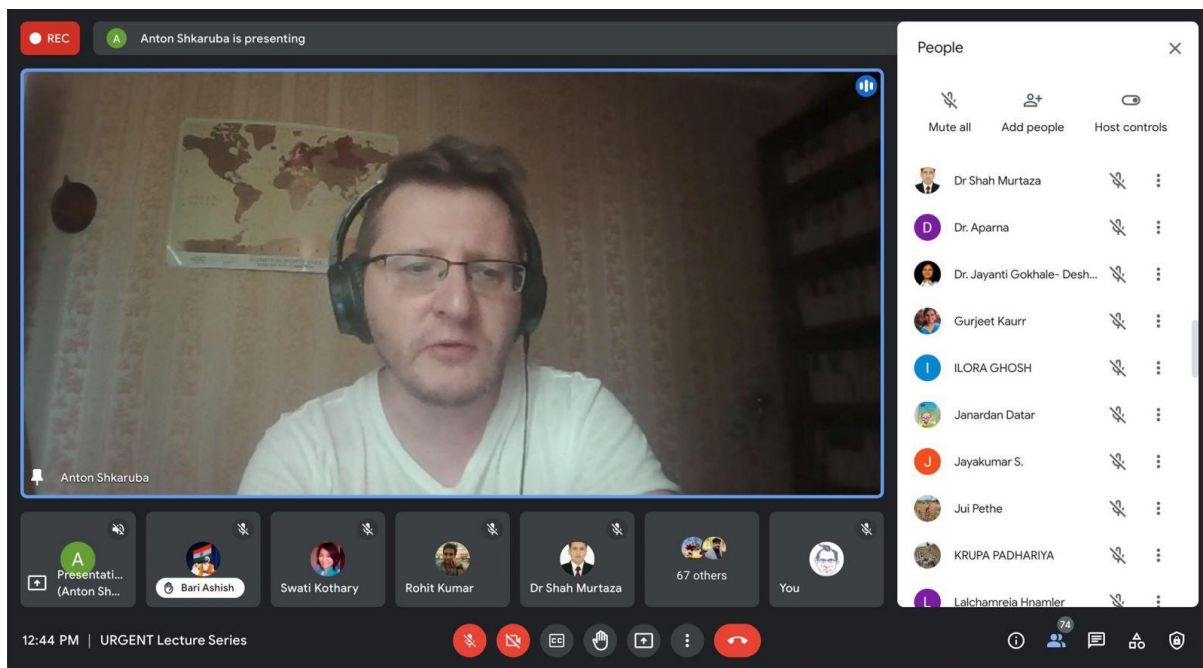

The need of the hour is to move beyond individual and stand-alone initiatives to a more [connected and collaborative approach](#). Research and cooperation at different levels of governance and among institutions will be critical in developing integrated climate, development, and biodiversity action plans, to effectively address the intertwined challenges. In order to successfully mainstream nature-based solutions in city-level development planning, there is a need to make informed choices regarding the identification of appropriate solutions specific to the city's requirements.

It is also vital [to create awareness and build capacities of local government and institutions](#) to take forward the implementation of nature-based solutions in cities. Faster adoption and effective implementation will also require adequate finance. Warje Forest in Pune and Miyawaki Forest in Chennai are examples of greening efforts that were supported by private entities for replication and scale-up. The role of public participation is indispensable when it comes to adopting nature-based solutions such as enhancing green cover and urban biodiversity.

Hence, collaboration and cooperation among different stakeholders such as local authorities, Urban Local Bodies, research and academic institutions, civil society, and citizens would be enablers for implementing nature-based [solutions](#) at scale. And finally, a well-designed communication strategy to popularise and demystify nature-based solutions would enable greater acceptance of the concept among stakeholders.

A coordinated effort in the planning and implementation of [nature-based solutions](#) is critical to its success in our rapidly growing urban areas. Since nature-based solutions have the potential to address the societal challenges prevalent in these regions, they hold the key to transforming our cities into resilient, vibrant, and sustainable spaces in the future.

*Suchismita Mukhopadhyay, Associate Director, and Saurav Chowdhury, Senior Programme Officer, Climate Change and Energy Programme, WWF India.*

## Nature-based solutions, the Concept, and Lessons from NBS development

European Commission's (2015:4) definition: nature-based solutions are interventions "inspired and supported by nature, which are cost-effective, simultaneously provide environmental, social and economic benefits and help build resilience. Such solutions bring more, and more diverse, nature and natural features and processes into cities, landscapes and seascapes, through locally adapted, resource-efficient and systemic interventions"

The International Union for Conservation of Nature (IUCN) understands NBS as "...actions to protect, sustainably manage and restore natural or modified ecosystems, which address societal challenges (e.g., climate change, food and water security or natural disasters) effectively and adaptively, while simultaneously providing human well-being and biodiversity benefits"

| Environmental  | Social  | Economic   | Urban Design                                  |
|--|---|--|---|
| Adapting to climate change   | Enabling and encouraging everyday physical activity         | Investment in local areas increases value of housing           | Creating a distinct sense of place            |
| Urban water management   | Decreasing stress   | Attracting visitors and increases local spending               | Positive image of safe and clean area         |
| Reducing air pollution   | Improving mental health                                     | Reducing costs of healthcare                                   | Improving accessibility                       |
| Enhancing urban biodiversity, providing habitat for wildlife         | Creating spaces for play and recreation                     | Cost-effective in relation to grey infrastructure alternatives | Providing extra functionality to urban space  |
| Regulating microclimate - reducing heat stress and urban heat island | Fostering social bonds, community development and inclusion | Job creation during and after installation                     | Adaptability                                  |
| Reducing energy use (heating, cooling)                               | Increasing access to locally sourced products, food, etc.   | Social entrepreneurs utilizing vacant urban space              | Contributing to cultural identity of the city |

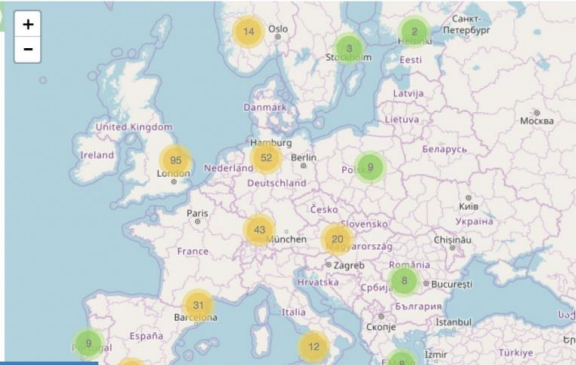

# URBAN NATURE ATLAS

## ABOUT THE ATLAS

Welcome to the Urban Nature Atlas! It contains almost 1000 examples of Nature-Based Solutions from across 100 European cities.

Use the **Quick Search by icon** (to the right of the map) or the **Advanced Search** (below the map) to identify the projects fitting your interests.

The map will be updated to display the results of your search, and a list of all relevant projects is displayed below. Click on the title of projects for further information.

## SEARCH RESULTS

Displaying 1 - 10 of 974 matching NBS projects

Urban Park Rabet, Leipzig, Germany

The area of Neuschönfeld where the park is located was built in the 1970s. With residents continuously leaving the area, housing fell vacant and the quality of the area decreased. Therefore, it was determined a major regeneration area of Leipzig. The expansion and redevelopment of the Rabat park between Volkmarsdorf and Neustadt-Neuschönfeld shall create important impulses for leisure and recreation and develop a central "green switch" which contributes to sustainable urban development that also extends beyond the district (Ref. 2, 3 and 6). [Read more](#)

Hammarby Sjöstad, Stockholm, Sweden

**Hammarby Sjöstad, Stockholm, Sweden**

Hammarby Sjöstad is the first eco city district in Stockholm. It is a 'town around a lake' where the planning work begun in 1980s with an opportunity to expand the inner city of Stockholm. It is one of Stockholm's biggest urban development project and it focuses on water and eco-friendly solutions. As a part of the ambition to create an eco-friendly city district, investments in e.g. green spaces, walkways and several large parks, have been made. Furthermore, the Hammarby Model is the eco-cycle which describes environmental solutions used for energy, waste and water and sewage. (Ref. 1 and 2) [Read more](#)

Asomadilla Park, Córdoba, Spain

The park was designed to simulate a Mediterranean forest with 18 native species of Mediterranean flora. The water is being reused in order to avoid the depletion of aquifers (Ref. 1). Ecological vegetable gardens destined to community horticulture

## The 'C/O City' project

"The purpose of the C / O City project is to highlight the value of nature in the city, create planning documentation and develop concrete solutions that facilitate work with ecosystem services in urban planning." The three phases of the project are to develop tools and methods, verify and adjust the tools and make them available to key actors. The final phase (which the project has reached) is to test the tools/methods and evaluate them. (Note: the starting point of the project is the environmental profiling of the Royal Seaport; i.e. Norra Djurgårdsstaden). (Ref. 1)

Location: Stockholm, Sweden  
City population: 1,602,639  
Project duration: 2015 - 2017  
Project cost: Above 4 000 000 EUR  
Financing source(s): Public national budget, Public local authority's budget

## NBS for climate change adaptation and disaster risk reduction are actions that work with and enhance nature:

- to restore and protect ecosystems and
- to help society adapt to the impacts of climate change and slow further warming,

while providing multiple additional benefits (environmental, social, and economic)

## Types of barriers

- (1) fear of the unknown
- (2) the disconnect between short-term actions and long-term goals
- (3) the discontinuity between short-term actions and long-term plans
- (4) sectoral silos
- (5) the paradigm of growth

(Kabisch et al. 2016)

## Lessons from NBS development

- (1) NBS needs to be aesthetically appealing to citizens
- (2) NBS creates new green urban commons
- (3) experimenting with NBS requires trust in the local government and in the process itself
- (4) co-creation NBS requires diversity and learning from social innovation
- (5) NBS requires collaborative governance
- (6) an inclusive narrative of the mission for NBS can enable the integration of many urban agendas
- (7) NBS must be designed so that it can be learned and replicated in the long-term

(Frantzeskaki 2019)

#### Speakers

**Dr Andrew Adam-Bradford**

Visiting Researcher  
University of Surrey, UK

He is a humanitarian aid worker and Consultant Geographer specializing in food security and urban agriculture in crisis settings. He is an associate member of the RUAF (Resource Centre on Urban Agriculture and Food Security) Foundation and a fellow of the Royal Geographical Society. He has worked with UN-Habitat, UNDP, UNHCR and many NGOs as consultant. He is also Horticulture instructor and urban agriculture specialist with expertise in practical farm projects. He is former Senior Research Fellow with Coventry University, UK.

**Dr Richard Baines**

Principal Consultant  
Agri-Business & Community Development  
Gloucester, UK

He is a contract researcher and works with 'in-country' associates to develop sustainable agri-food solutions. His academic interests are agricultural and rural development in emerging economies. He has taught at the Royal Agricultural University, UK and was the Programme Manager of MSc in International Rural Development and Sustainable Agriculture & Food Security. He was also Co-Founder for African Fellowship Trust and Director of Programmes. To his credit he also has many books, articles and PhD research projects.
